Validation efforts for iodine behaviour models should be continued using the existing database and expanded to include forthcoming experiments such as EPICUR. Iodine behaviour in the containment - gas phase chemistry Volatile iodine will be present in the containment's atmosphere through two routes: from the RCS and from the sump water.

Excess iodine intake may also result in goiter, as well as in hyper- or hypothyroidism. High iodine intake has also been associated with increased risk for thyroid papillary cancer (Institute of Medicine 2001). For most people, iodine intake from usual foods and supplements is unlikely to exceed the tolerable upper intake level (1,100 µg/day).

water, and the iodine in the salt. In the presence of much organic matter in a sample for iodine determination, however, large quantities of CO<sub>2</sub> and other organic acids are produced in the ashing, and it is very difficult to prevent entirely the loss of iodine merely by the time-honored method

Iodine is a redox sensitive element forming a wide variety of organic and inorganic compounds and the most common inorganic forms of iodine are I<sup>-</sup> (iodide), HOI (hypoiodous acid), I<sub>2</sub> (elemental iodine), and IO<sub>3</sub><sup>-</sup> (iodate) in natural environmental pH conditions [38,39].

World iodine deficiency remains a public health concern. Supplemental iodine, however, represents an optimal approach to deficiency. There are currently various forms of supplemental iodine available, including liquid and tablet forms, both of which consist of either potassium iodine, or iodine derived from food sources such as kelp.

Iodine is easily oxidised, but about 90% of all iodine found in natural freshwater occurs as the anion I<sup>-</sup>. In groundwater, the average I-concentration is approximately 1 µg I<sup>-</sup> (ATSDR 2006). Iodine is a volatile element and atmospheric migration is a peculiar feature of iodine geochemistry, volatilisation of iodine being
