Once that system is in place, tweaking that design is more lateral evolution. The dividing line between vertical and lateral is not always clear cut, so we may need to define something in the middle, which is oblique evolution, or a combination of vertical and lateral evolution.

The evolution of spinal surgical practice has been driven by three primary goals: decompression, stabilization, and correction of deformity.<sup>1</sup> During the late 19th and early 20th centuries, surgical options for the treatment of lateral and paraspinous disease were limited. MÃ©nard and Capener pioneered approaches for the treatment of Pott

Teleost electroreceptors are distributed on both the head and trunk, and are part of the lateral line system; depending on their position, they are innervated by anterior (pre-otic) or posterior (post-otic) lateral line nerves, which project centrally to a special "electrosensory lateral line lobe" in the medulla (Bullock et al., 1983; Gibbs, 2004; Bell and Maler, 2005; Bodznick and Montgomery, 2005).
