Cobb-Douglas Based Firm Production Model in Fuzzy Environment In this paper, we consider a firm that uses  $n$  inputs (e.g. labour, capital, coal, iron) to produce one single output  $q$ . Suppose  $p$  is the cost / unit of output. The firm production function may be expressed as  $q = f(x)$ , 12

A fuzzy logic system (FLS) can be defined as the nonlinear mapping of an input data set to a scalar output data [2]. A FLS consists of four main parts: fuzzyifier, rules, inference engine, and defuzzyifier. These components and the general architecture of a FLS is shown in Figure 1. Figure 1: A Fuzzy Logic System.

Fuzzy rules are used within fuzzy logic systems to infer an output based on input variables. Modus ponens and modus tollens are the most important rules of inference. A modus ponens rule is in the form Premise: x is A Implication: IF x is A THEN y is B Consequent: y is B. In crisp logic, the premise x is A can only be true or false.

Purpose “ The purpose of this paper is to explore causal complexity in the relationship between environmental proactivity and firm performance. Using data collected from 27 Australian firms and controlling for the organizational life cycle, type of industry and external contingencies, the study empirically examines environmental proactivity in high-performing firms from polluting industries.
